RESULT 13

US-10-997-201A-13

Sequence 13, Application US/10997201A

Publication No. US20050249739A1

GENERAL INFORMATION:
APPLICANT: Marasco, Wayne

APPLICANT: Sul, Jianhua

TITLE OF INVENTION: Antibodies Against SARS-COV and Methods of Use Thereof

FILE REFERENCE: 2003-11-24

CURRENT APPLICATION NUMBER: US/10/997,201A

CURRENT APPLICATION NUMBER: 60/524,840

PRIOR FILING DATE: 2003-11-25

NUMBER OF SEQ ID NOS: 40

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 13

LENGTH: 28
OTHER INFORMATION: Lys residue modified with a Biotin JJ spacer linker

New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nandscale molecular sieves.

Disclosure; Page 9; 45pp; English

The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                   New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                               The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Porce Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 28;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is a peptide used to form blunt-ended heterodimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Force
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to fibre-shaping (FiSh) peptides ADM41434-ADM41435 that are capable of interacting with SAFs to form protein structures. The FiSh peptides allow morphological changes (branches, splits, kinks and bends) to be made to protein fibres comprising SAFs. By incorporating such morphological changes in the protein fibres, it is possible to generate a variety of (nanoscale) protein fibres, it is assemblies in general, including matrix, filter, network, grid and saffold structures. Use of the protein structures in the purification of biological fluids, for assembling cells for cell and tissue engineering, and in surface engineering,
            The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Acomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p2A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel fiber-shaping peptide comprising hub and several peptide monomer units, useful for producing protein structure useful in purification of biological fluids and in surface engineering procedures.
                                                                                                                                                                                Gaps
                                                                                                                                                                                .

The present invention relates to a composition which comprises a pair of antibody FV fragments linked and stabilised by antiparallel heterogeneous antibody FV fragments linked and stabilised by antiparallel heterogeneous form multimeric complexes and therapeutic antibodies and antibody fragments useful for e.g. inhibition of receptor binding and the trangeling of drugs, toxins and labels in research, industry and healthcare. The present sequence is an AHEC peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Composition useful for forming therapeutic antibodies and antibody fragments comprises pair of antibody Fv fragments linked and stabilized by antiparallel heterogeneous alpha-helical coiled-coil peptides.
                                                                                                                                                                                                       chain; stabilisation; assembly; alpha-helical coiled-coil;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second upptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-pl

                                                                                                                                                                                                                                                                         The present sequence is that of self-assembling peptide fibre (SAF) SAF-pl. The invention relates to fibre-shaping (FiSh) peptides ADM41434-ADM41435 that are capable of interacting with SAFs to form protein structures. The FiSh peptides allow morphological changes (branches, splits, kinks and bends) to be made to protein fibres comprising SAFs. By incorporating such morphological changes in the protein fibres, it is possible to generate a variety of (nanoscale) protein structures, such as assemblies in general, including matrix, filter, network, grid and scaffold structures. Use of the protein structures in the purification of biological fluids, for assembling cells for cell and tissue engineering, and in surface engineering procedures is claimed.
Novel fiber-shaping peptide comprising Mub and several peptide monomer units, useful for producing protein structure useful in purification of biological fluids and in surface enginedring procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p1B
                                                                                                                                                                                    New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New protein structures with peptide monomer units, useful in Atomic Force Microscopy, purifying biological fluids, promoting tissue repair and tissue engineering, or constructing nanoscale molecular sieves.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is a peptide used to form blunt-ended heterodimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second upptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-plA

The present invention relates to a composition which comprises a pair of antibody Fv fragments linked and stabilised by antiparallel heterogeneous alpha-helical coiled-coil (AHEC) peptides. The composition is used to form multimeric complexes and therapeutic antibodies and antibody fragments useful for e.g. inhibition of receptor binding and the targeting of drugs, toxins and labels in research, industry and healthcare. The present sequence is an AHEC peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                             Composition useful for forming therapeutic antibodies and antibody fragments comprises pair of antibody Fv fragments linked and stabilized by antiparallel heterogeneous alpha-helical coiled-coil peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibody Fv chain; stabilisation; assembly; alpha-helical coiled-coil; AHEC; antiparallel; drug targeting.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a protein structure with several first peptide monomer units arranged in a first strand and several second peptide monomer units arranged in a second strand. The structure is useful in Atomic Force Microscopy and a number of other applications. The present sequence is the peptide monomer unit SAF-p3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Force
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                   The present invention relates to a composition which comprises a pair of antibody FV fragments linked and stabilised by antiparallel heterogeneous alpha-helical coiled-coil (AHEC) peptides. The composition is used to form multimeric complexes and therapeutic antibodies and antibody fragments useful for e.g. inhibition of receptor binding and the rargeting of drugs, toxins and labels in research, industry and healthcare. The present sequence is an AHEC peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU1255-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HV-1LAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence of absence of a test compound, in a reaction mixture containing DP107 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a
                        Composition useful for forming therapeutic antibodies and antibody fragments comprises pair of antibody Fv fragments linked and stabilized by antiparallel heterogeneous alpha-helical coiled-coil peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive camino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTIS, contains a maino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTIS.

CC 107x1784 or PLIZIP sequence search motife, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, on macromolecular carrier group, and comprises a carboxyl group, amid group, hydrophobic group, or macromolecular carrier group, and cluston of the virus to the erructure/encits present in the HIV-1 glycoprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat motific containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic confaminas and HIV isolates, looking for DP107/178 structural analogues.

The method is useful for inhibiting transmission of Epstein-Barr virus to a cell and Epstein-Barr virus infection. The present sequence is a heptad
                                                                                                                                                                                                                         ö
DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may thembelves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfetted cells. The present sequence represents a peptide sequence from yeast GCN4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting transmission of Epstein-Barr Virus to a cell, by contacting the cell with a peptide consisting of a tegion of Epstein-Barr virus
                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (M1) for the staged assembly of a nanostructure using peptide nucleic acids (PNAs). M1 comprises: (a) contacting a nanostructure intermediate (NSI) having at least one unbound contacting a nanostructure intermediate (NSI) that comprises several different JBs where: (i) none of these JBs can interact with itself or cher JBs and (ii) only one JB in AU and a single unbound JBs in NSI are complementary, so that AU becomes non-covalently linked to NSI to produce complementary, so that AU becomes non-covalently linked to NSI to produce a new NSI for us in subsequent cycles; (b) removing unbound AU; and (c) cyclic repetition of (a) and (b) to form a nanostructure. The new feature cycle is that the complementary JB in at least one cycle are PNAs. Also described are nanostructures formed from many AU. comprising different JB, where at least one AU includes PNA. M1 is useful for producing nanostructural reinforcements (for aerogels, paper; plastics or cement, conterticularly as long fibres to improve tensile strength); identification carticularly as long fibres to improve tensile strength; identification carticularly as long fibres to improve tensile strength; identification carticularly conterfeiting) markers; enzyme or catalyst supports; assembly contical and other surface coatings; scaffolds for solubilising enzymes or contrapping, protecting and delivering specific molecules; in high-

```

```
The invention relates to staged assembly of a nanostructure comprising:

(a) contacting a nanostructure intermediate comprising at least one unbound joining element with an assembly unit comprising different joining elements; (b) removing unbound assembly units; and (c) repeating steps (a)-(b) for a sufficient number of cycles to form a nanostructure, where the assembly unit in at least one cycle comprises a peptide nucleic acid. A single joining element of the different joining element of the sesembly unit is non-covalently bound to the nanostructure intermediate are bound to the nanostructure intermediate to form a new nanostructure intermediate to form a new nanostructure intermediate to form a new nanostructure intermediate to form a new nanostructure.
                                                                                                                                                                                                                                                                                                                                                                                                                      ö
density computer memories; as artificial zeolite for absorbing ions from water and for construction of new materials, including use in biosensors. PNAs are more homogeneous than inorganic nanoparticles generally used to form nanostructures, so will produce structures with predictable geometry and stoichiometry. The present sequence represents a canonical leucine zipper and high stability dimerisation sequence peptide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Staged assembly of a nanostructure containing peptide nucleic acid assembly units comprises contacting a nanostructure intermediate with an assembly unit comprising different joining elements, and removing unbound assembly units.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of a nanostructure further comprises: (i) capping the nanostructure with at least one capping unit; and (ii) post-assembly conversion of specific non-covalent interactions of complementary joining elements to covalent linkages, where the linkages are stabilised. The nanostructure intermediate comprises a surface bound initiator assembly unit. A first assembly unit used in at least one cycle comprises at least one structural element covalently linked to a first joining element
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

ö
              a second structural element to form a stable complex. The structural element is covalently linked to the first joining element and to a second joining element, comprising a peptide nucleic acid. The assembly unit further comprises a functional element, comprises no element, comprises a photonic nanoparticle, inorganic ion, carbon nanotube, lectin or chemiluminescent molecule. The assembly unit comprises sub-assembly unite that bind to each other to form a complex. The present sequence represents a peptide used as a functional element in the method of the
comprising a peptide nucleic acid, or a first structural element bound to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 may be used to transform plants to increase the content of partic. amino acids such as lysine or methionine in seeds or leaves. The invention relates to a new composition comprising a heparin binding molecule (HBM) having a heparin binding unit (HBU). Also described are molecule (HBM) having a heparin binding unit (HBU). Also described are (i) a mucleic acid comprising a sequence encoding a heparin-binding complement of the sequence encoding a heparin in a sample, (iv) a method for detecting heparin, (v) a method of removing heparin from a sample, (vi) a method for detecting heparin or coated with HBM, (ax) a method of removing heparin from a sample, (vi) a method of properties and instructions, (viii) an apparatus comprising a medical device coated with HBM, (ix) a method of manufacturing a medical device, and (x) a method of neutralizing heparin in a subject. The composition further comprises a linker and a second HBU and a second linker and a third HBU. The heparin-binding unit comprises a peptide having at least 80% identity to a first, second and third HBU comprises a fully defined 9-amino acid sequence (SEQ ID NO: 1). The HBM is fused to a bacterial glutathione-stransferase (GST). The GST-HBM is also fused to a bacterial alkaline phosphatese (BAP). The CST-HBM is also fused to an enhanced green thouse the composition is useful in neutralizing the composition is useful in neutralizing the composition is useful in neutralizing the contains an amino acid sequence contains the composition is a sequence of sequence represents an amino acid sequence contains the composition is a sequence represents an amino acid sequence contains the contains the composition is a sequence of the contains the composition is useful in neutralizing contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the contains the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a new composition comprising a heparin binding molecule (HBM) having a heparin binding unit (HBU). Also described are (1) a mucleic acid comprising a sequence encoding a heparin-binding concerned (ii) a mucleic acid (ii) an assay for detecting heparin. (iii) a molecule (HBM) mucleic acid, (ii) an assay for detecting heparin. (iii) a method for detecting heparin in a sample, (iv) a method for detecting heparin on cated surfaces, (vi) a method concerned for detecting heparin on cated surfaces, (vii) a kit comprising a HBM, color developing reagent, control standards, wash control structions, (viii) an apparatus comprising a medical device coated with HBM, (ix) a method of manufacturing a medical device, and (x) a method of neutralizing heparin in a subject. The composition further comprises a linker and a second HBU and a second linker and a third HBU.

The heparin-binding unit comprises a peptide having at least 80% identity to a fully defined sequence (52 ID NO: 6). The first, second and third HBW is also fused to a bacterial alkaline transferase (657). The GST-HBM is also fused to a bacterial alkaline thrown and the sequence (550). The GST-HBM is also fused to a bacterial alkaline thrown and the sequence (560) and third HBM: a last of the off on an interval interval to a bacterial alkaline thrown and the sequence (560). The GST-HBM is also fused to a bacterial alkaline thrown and the sequence (560) and third fused to a bacterial alkaline thrown and the sequence (560) and the comprise of the off to an enthod of a sequence (560) and third fused to a bacterial alkaline thrown and the sequence (560) and the comprise of the off to an enthod of a sequence (560) and the comprise of the off to an enthod of a sequence (560) and the comprise of the off to an enthod of a sequence of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the comprise of the compr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising a heparin binding molecule (HBM) having a
heparin binding unit (HBU), useful in neutralizing heparin in a subject.
                                                                                                   heparin binding protein; assay; heparin; anticoagulant; blood-clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           fluorescent protein (EGFP). The composition is useful in neutralizing heparin in a subject. This sequence represents an amino acid sequence relating to the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Integrin; transmembrane protein; alpha4 integrin inhibitor; paxillin;

```
The present sequence is given in a specification relating to a polypeptide comprising a series of heptad-repeats that minic a transmembrane domain, and a selected cytoplasmic domain attached to the heptad repeats. At least a portion of the polypeptide is prepared recombinantly or at least 1 heptad repeat in the series has a different amin acid sequence to other heptad repeat in the series. The polypeptide is useful in the construction of structural models which are useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein having the selected cytoplasmic domain and for identifying the structural model with paxillin or a paxillin related molecule in the presence and absence of a test agent and determining binding of paxillin or paxillin related molecule to the structural model. A decrease in binding of the presence of the test agent indicates that the test agent is an inhibitor of alpha4 integrin biological response. In immining such as inflammatory bowel disease, in the test agent is an inhibitor of alpha4 are useful in blocking conductions such as inflammatory bowel disease, in this inconductions and ashend and in inhibit in the inhibitor of a conduction such as inflammatory bowel disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Heptad repeat; transmembrane domain; cytoplasmic; integrin; inflammation; thrombosis; malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to heptad repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

```
fragments optionally linked to a backbone where the peptides are fragments optionally linked to a backbone where the peptides are spatially positioned relative to each other to form non-linear sequences which mimic the tertiary structure of pathogenic prion protein PrBG-compationed pecific epitopes and have the same or higher degree of conformational sensitivity to PrBG. The conjugate of the invention demonstrates neusrivity and may be useful for producing antibodies specific for PrBGs for use in medicine, vaccines, high-throughput screening and as direct probes or reporter substances in assays for detection of PrBGs. Furthermore, the conjugate and peptides may be useful for treating and/or preventing creuzzfeldt-Jakob disease, kuru, Gerstmann-Straussler-Sheinker syndrome, fatal familial insomnia and transmissible spongiform encephalopathies, such as bowine spongiform encephalopathies in sheep, chronic wasting disease in deer and elk and transmissible encephalopathies in mink, cat and other animals. The current sequence is that of a prion protein PrP-related backbone
                                                                                        Conjugate useful for treating transmissible prion disease, e.g., kuru, comprising two or more peptides or its fragments optionally linked to backbone form to non-linear sequences which mimics tertiary structure of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic polypeptide(s) contg. specified heptad units - expressed in vivo in plants to serve as custom-tailored storage proteins with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                        Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats.
                                                                                                                                                                                                                                                                                                                     The present invention relates to a peptide with a series of heptadrepeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation, thrombosis and malignancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prion; PrPSc; vaccine; Creutzfeldt-Jakob disease; kuru;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonuclectide SM98 (AAQ95000) and complementary sequence SM99 (AAQ95001) code for 4 repeats (AAR78256) of heptad peptide SSP7 (see also AAR78237). Clone 5-1 (AAQ95005) was obtd. by insertion of the uligonuclectides into the Barl site of clone 84-H3 (see AAQ94993) and transformation of Escherichia coli DHS alpha. Synthetic storage protein SSP5-1 (AAR78259) encoded by the construct can be used to raise the lysine content in seeds of transformed plants
                                         The sequence represents a synthetic polypeptide comprising heptad units of the peptide. The synthetic polypeptide can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be customtailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. amino acids such as lysine or methionine in seeds or leaves. See also AAR31979-86 and AAR32659-705. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a plant compriging two foreign nucleotide

sequences which cause seeds obtained from the plant to accumulate lysine

at a level of at least 10% higher than deeds of a plant that do not

comprise the nucleotide, where the nucleotide comprises a fragment

comprise the nucleotide, where the nucleotide comprises a fragment

comprise the nucleotide, where the nucleotide comprises a fragment

comprise the nucleotide, where the nucleotide comprises a fragment

comprise the nucleotide, where the nucleotide fragment

comprise the nucleotide of succession and a fragment of succession in the nucleotide fragment

comprise inhibition, and a fragment choroplagt transit sequence (CTS) and the

comprision or cosuppression. Also included are progeny plants from the

above mentioned plant and seeds obtained from the above mentioned plant

comprising the foreign nucleic acid sequences accumulate

comprising the foreign nucleic acid sequences accumulate

comprise to higher level, preferably at a level of at least 10% higher

comprise of a plant that do not comprise the foreign nucleic acid

comprised are suppression of second of sequences accumulate

compartokinase III (from the lysc gene of septone of sequence of lysine) are also used to generate the above transgenic plants. Also

disclosed are suprised to promery sequence of lysine, built up from synthetic peptide monomers based around

an Barl site sequence (for generating mutlimeric proteins). The present

compared to an SSP peptide monomer.

The invention relates to an isolated nucleic acid fragment comprising a first nucleic acid subfragment encoding aspartokinase (AK) that is substantially insensitive to inhibition by lysine, and a second nucleic acid subfragment encoding dibydrodipicolinic acid synthase (DHDPS) that is substantially insensitive to inhibition by lysine. Also included are is substantially insensitive to inhibition by lysine. Also included are encoding lysine ketoglutarate reductase (LKR), a chimaeric gene (Where the nucleic acid fragment is operably linked to a plant chloroplast transit sequence and to a seed-specific regulatory sequence, a plant comprising the nucleic acid/chimaeric gene in its genome, a seed obtained from the plant, increasing threconine or lysine content of the seeds of plant, a plant capable of transmitting the chimaeric gene to a progeny of plant, a plant capable of transmitting the chimaeric gene to a progeny of plant worlines greater than the free threconine levels of untransformed least two times greater than the free threconine are levels at least ten percent to four-fold higher than the seeds of an untransformed plant, a transformed rapeseed comprising seeds that accumulate lysine to a level between ten percent and one hundred percent comprising in its genome the nucleic acid fragment having the monocot cenbryo specific promoter and a transformed corn plant comprising the monocot cenbryo specific promoter and a transformed corn plant comprising seeds that accumulate lysine to a level between ten percent and one hundred Example 21; Page 44; 116pp; English.

The invention relates to a novel isolated nucleic acid sequence which is useful in antisense inhibition or sense suppression of endogenous lysine ketoglutarate reductase/saccharopine dehydrogenase activity in a corn plant cell, where the isolated nucleic acid fragment comprises all or a part of a nucleic acid sequence (ADWIJ743). The isolated nucleic acid fragment is useful for increasing levels of lysine in the seeds of transformed plants. The present sequence represents a peptide encoded by an oligonucleotide used to create chimeric genes of

ö
thirty percent higher than the seeds of the untransformed plant. Also disclosed are synthetic lysine-rich seed storage proteins (SSP), built up from monomer lysine-rich heptad repeats (encoded by Barl restriction enzyme-based oligonucleotides) used as a pool of lysine in a transformed plant. The nucleic acid fragments, genes and methods are useful for increasing threonine or lysine content of the seeds of the plant. Seeds supplement mixed grain feeds with lysine or threonine produced via microbial fermentation. The present sequence is a lysine-rich heptad repeat for use as a monomer unit in a synthetic seed storage protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated lysine ketoglutarate reductase/saccharopine dehydrogenase

```
The sequence represents a synthetic heptad polypeptide which can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be custom-tailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. amino acids such as lysine or methionine in seeds or leaves. See also See also ARX11979-86 and AAR32659-705. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Heptad; plants; custom tailored storage proteins; in vivo; expression.

                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence is domain 1 from the integrase like protein Rci. The whole coding sequence of the enzyme could be included in an expression vector in order to aid its integration into its host. The expression vector also includes at least the secretion signal of a lipoprotein and a second sequence encoding a heterologous protein and a mycobacterial promocer to control expression of the heterologous protein. (Updated on 09-JAN-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)

The synthetic polypeptide can be expressed in vivo in plants to serve as a synthetic seed storage protein which can be custom-tailored for specific end-user requirements. The DNA encoding the heptad may be used to transform plants to increase the content of partic. amino acids such as lysine or methionine in seeds or leaves. See also AAR31979-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide SM96 (AAQ94998) and complementary sequence SM97 (AAQ94999) code for 4 repeats (AAR78255) of heptad peptide SSP5 (see also AAR78238). Clone 3-5 (AAQ95000) was obtd. by insertion of the first 22 bases of the SM96-SM97 set into the Ear. site of clone 82-4 (see AAQ94992) and transformation of Escherichia coli bHS alpha. Synthetic storage protein SSP9-5 (AAR78265) encoded by the construct was used to raise the lysine content in seeds of transformed tobacco, soybean and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New chimeric gene providing increased lysine content in plant seeds -contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

heptad SSP5 repeats (see AAR78238) flanked by SSP5 heptads (see AAR78236) derived from vector pSK6. It was obtd. by insertion of SSP5-encoding obligonacleotides (AAQ94974.75) into pSK6 and use of the resulting vector to transform Escherichia coli UM103, yielding clone D33 (AAQ94983). The SSP forms a coiled-coil structure. It can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase lysine content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New chimeric gene providing increased lysine content in plant seeds -contains di.hydro.di.picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lysine-rich synthetic storage protein SSP 5.5.5 (AAR78250) comprises 2 heptad SSP5 repeats (see AAR78238) flanked by SSP5 heptads (see AAR78236) derived from vector pSK6. It was obtd. by insertion of HPLC-purified SSP5-encoding oligonucleotides (AAQ94974-75) into pSK6 and use of the resulting vector to transform Escherichia coli JM103, yielding clone 84-H3 (AAQ94933). The SSP forms a coiled-coil structure. It can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New chimeric gene providing increased lysine content in plant seeds -contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                   요
                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                     Lysine-rich synthetic storage protein SSP 5.5.5 (AAR78242) comprises 2 heptad SSPs repeats (see AAR78238) flanked by SSP5 heptads (see AAR78236) derived from vector pSK6. It was obtd. by insertion of SSP5-encoding oligonucleotides (AAQ94974-75) into pSK6 and use of the resulting vector to transform Escherichia coli UM103, yielding clone D16 (AAQ94981). The SSP forms a coiled-coil structure. It can be expressed in the seeds of transformed plants, e.g. soybean and corn, to increase lysine content
                                                                                                                                                                                                                                                                                                  New chimeric gene providing increased lysine content in plant seeds - contains di:hydro:di:picolinic acid synthase gene coupled to chloroplast transport sequence and seed specific promoter, also new plants of improved nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

AAW62920-67 represent minimalist lytic (channel forming) peptides. The peptides have antibacterial properties in concentrations not lethal toward mammalian cells. The peptides are heptads (or heptad multimers) that comprises four nonpolar amino acid residues and three positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues. The nonpolar amino acid residues and the positively charged amino acid residues are distributed within the heptad such that when the multimer forms an alpha-helix the nonpolar amino acid residues will lie on one face of the alpha-helix, and the positively charged amino acid residues will lie on the opposite face of the alpha -helix, whereby the multimer is amphipathic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                            Selective lysis of bacteria amongst mammalian cells - using 14-mer or 21-mer lytic peptides.

                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric genes encoding lysine production enzymes - useful for increasing transgenic seed lysine content without being inhibited by high levels of the amino acid.
                                         Chimeric genes encoding lysine production enzymes - useful for increasing transgenic seed lysine content without being inhibited by high levels of the amino acid.
                                                                                                       The present sequence represents a synthetic lysine rich, storage protein of the specification. The sequence can be operably linked to a seed-specific regulatory sequence to create a chimeric gene of the specification. The specification also describes a Corynebacterium dapa gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chincipiast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max). (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dihydrodipicolinic acid synthase; DHDPS; chimeric gene; storage protein; lysine inhibition; plant chloroplast transit sequence; plant seed-specific regulatory sequence; transgenic plant; increased lysine level; con; Zea mays; soybean; Glycine max.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a synthetic lysine rich, storage protein of the specification. The sequence can be operably linked to a seedspecific regulatory sequence to create a chimeric gene of the specification. The specification also describes a Corynebacterium dapagene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dihydrodipicolinic acid synthase; DHDPS; chimeric gene; storage protein; lysine inhibition; plant chloroplast transit sequence; plant seed-specific regulatory sequence; transgenic plant; increased lysine level; corn; Zea mays; soybean; Glycine max.
                                                               storage protein
                                              The present sequence represents a synthetic lysine rich, storage protein of the specification. The sequence can be operably linked to a seedspecific regulatory sequence to create a chimeric gene of the specification. The specification also describes a Corynebacterium dapp gene, which encodes a dihydrodipicolinic acid synthase (DHDPS) enzyme, which was used to create chimeric genes of the invention. The chimeric genes contain a nucleic acid fragment encoding a DHDPS enzyme which is insensitive to inhibition by lysine operably linked to a plant chloroplast transit sequence and to a plant seed-specific regulatory sequence. The chimeric genes are useful for producing plants containing increased levels of lysine, especially in corn (Zea mays) and soybean (Glycine max). (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW60510;
```

```
CC insensitive to inhibition by lysine operably linked to a plant
CC chloroplast transit sequence and to a plant seed-specific regulatory
CC sequence. The chimeric genes are useful for producing plants containing
CC increased levels of lysine, especially in corn (Zea mays) and soybean
CC (Glycine max). (Updated on 25-MAR-2003 to correct PR field.)
